Description

Aquamail considerably increases water retention in the subsoil, allowing water to penetrate more quickly. Small bottle of 60 ml. Avoid crust formation on the earth's surface. Dosage 1 capful per 10 litres of water. Water once in the spring and once at the beginning of summer. Keep safe from light and frost. Used by many professionals, very efficient on peat-based composts but also on Japanese earth. Aquamail is non phytotoxique, biodegradable and non ionic. With Aquamail the water drops don't drag the soil: they penetrate more easily in dry or packed earth. The roots are humidified in a more uniform and faster way with less runoff. This agent is very useful for plants that haven't been repotted for several years.
