Description

Small bottle 100Gr. **This ENDO mycorrhize treatment contains a different mix to our other product and is meant for fertilising orchids, maple, juniper, ash, elm, fruit and tropical bonsai trees. See the list below.**

It's especially good for bonsai with root problems such as excess water or root rot. It's highly recommended that you use this product when potting trees found in the forest (yamadori) that you want to train into a bonsai.

Benefits: mycorrhize may reduce infection by bacteria and fungi that cause plant diseases. It can also help fix vital nutrients, promoting plant growth.

How to use: Use 1 to 3 capfuls per tree, make four or five holes in the earth, near the trunk and surface roots (not in the bottom of the pot), and add some powder to each. Re-cover the holes with earth afterwards.

Species:

Acer (Maple)
Monkey Puzzle
Catalpa

Juniper – Cypress – Taxus - Thuja

Ericaceae

Azalea – heather - rhododendron
