Description

Diameter of the trunk on its base : about 130-140 mm. With its right and soared up trunk, that tree will be perfect in the collection of an aware collector who particularly likes the trees with a natural structure.

It comes from one of the most famous Japanese nurseries : Master Katoh's nursery, Omiya garden.

Daily and generous watering is vital because fagus tree is sensitive to drought.

You may use tempered and soft water and spray regularly the leaves so that you can keep an important humidity level around the tree. During summer, leaves usually dry out with warm winds vththat is why we recommend you to use windbreak nets.

During autumn your fagus will have a beautiiful brown foliage that keep attached to the tree by the stalks.

Photographed in december 2022, with its foliage in summer 2022 and during budding in spring. Shelf not included. See more pictures here : [gallery](#).
